

MyVault Stage 5 PDF Runtime Fixture

Page and selection verification document

This document exists only to verify the production PDF reader. It contains selectable text, multiple lines, and enough content to flow across pages.

Section 1 - Selection geometry

Genuine PDF text selection must preserve every selected line as one logical annotation while retaining ordered page-aware rectangles for rendering.

The first compatibility rectangle remains available to older clients, while new Android versions retain the complete selection geometry additively.

Historic annotations must remain intact when the reader opens and closes.

Line 01: The reader keeps selectable text anchored to the source document.
Line 02: Highlight colours change one logical annotation, not its fragments.
Line 03: Notes, tags, and Study links remain attached to the parent record.
Line 04: Drawing remains distinct from genuine selected-text highlighting.
Line 05: Opening Explorer must not recreate or blank the PDF renderer.
Line 06: Immersive mode hides chrome without moving the document position.
Line 07: The compact page counter opens the page-jump sheet.
Line 08: Page notes remain separate from selected-text notes.
Line 09: Activity filters use real persisted production data.
Line 10: White PDF paper remains unchanged in Light, Dark, and OLED themes.
Line 11: Zoom and pan must not detach annotations from their source text.
Line 12: Reopening the document must restore reading progress safely.
Line 13: Native selection and custom actions must coexist with scrolling.
Line 14: The reader must preserve links and file identity.
Line 15: Backup extensions remain optional for older clients.
Line 16: Invalid extension geometry falls back to the parent rectangle.
Line 17: Historic text boxes are preserved even when creation is hidden.
Line 18: No viewer initialization may delete compatibility records.
Line 19: Narration uses existing production providers and playback state.
Line 20: The global mini-player remains unchanged by the PDF reader port.
Line 21: Selected text can create a linked Study note.
Line 22: Existing Study notes can be linked from annotation actions.
Line 23: Annotation tags remain distinct from attachment tags.
Line 24: Current-page activity remains a secondary surface.
Line 25: File-management actions remain owned by Library.
Line 26: Continuous vertical pages remain native to AndroidX PDF.
Line 27: Loading and unavailable states remain truthful.
Line 28: Multi-line selection must remain one logical annotation.
Line 29: Ordered segments must survive save and reopen.
Line 30: Deleting the parent removes all child segments.

Section 2 - Repeated navigation

The second section provides additional content so the document spans several pages and can verify middle-page and last-page navigation.

Line 31: Page navigation rejects zero and values beyond the page count.
Line 32: A valid middle page scrolls to the requested destination.
Line 33: Returning from PDF Activity preserves the selected annotation target.
Line 34: Explorer opening changes available width without remounting content.
Line 35: Closing Explorer restores width without a white renderer flash.
Line 36: Theme changes preserve annotation and page state.
Line 37: Annotation note text remains available in Activity search.
Line 38: Draw highlights remain correctly positioned after a relaunch.
Line 39: Selection rectangles remain ordered across wrapped lines.

Line 40: Cross-page selections remain page-aware when AndroidX supplies them.
Line 41: Copy uses actual renderer-selected text rather than OCR.
Line 42: The Note action quotes the actual selected text.
Line 43: Listen from here receives the renderer selection text.
Line 44: Page notes do not fabricate selected-text context.
Line 45: The annotation count reflects real current-page data.
Line 46: The activity destination remains contextual, not a permanent rail.
Line 47: Reader overflow remains compact and restrained.
Line 48: Save to device and Delete remain outside reader chrome.
Line 49: PDF content is never inverted for OLED.
Line 50: The surrounding OLED canvas remains true black.
Line 51: Dark mode remains visually distinct from OLED.
Line 52: Light mode uses the shared cool MyVault application canvas.
Line 53: Selection controls remain legible over white PDF paper.
Line 54: Bottom sheets retain modal focus and system insets.
Line 55: Back exits immersive mode before leaving the document.
Line 56: Unclaimed single taps reveal hidden chrome.
Line 57: Drawing and links must not trigger chrome reveal accidentally.
Line 58: Zoom gestures remain owned by the native renderer.
Line 59: TalkBack labels identify reader controls clearly.
Line 60: No mock or fabricated annotation data is shown.

Section 3 - Final page

The final page verifies last-page navigation, long scrolling, and persistence.

Line 61: Last-page navigation reaches this section.
Line 62: Reading progress records the current page and total count.
Line 63: Reopening returns to the stored page where production supports it.
Line 64: Existing attachment identity remains unchanged.
Line 65: Existing annotation IDs remain unchanged.
Line 66: Existing relationship IDs remain unchanged.
Line 67: Room migration remains additive and non-destructive.
Line 68: Legacy annotations need no bulk rewrite.
Line 69: New annotations retain a valid representative legacy rectangle.
Line 70: Complete geometry remains in ordered child segment rows.
Line 71: Selected text is optional for draw and legacy annotations.
Line 72: Selected text comes directly from AndroidX selection.
Line 73: Malformed child data cannot delete the logical parent.
Line 74: Backup restore ignores malformed extensions safely.
Line 75: Older clients can ignore the additive geometry file.
Line 76: Web parsing remains compatible with the legacy annotation file.
Line 77: Full destructive backup restore remains reserved for Stage 10.
Line 78: Stage 5 changes do not begin Courses work.
Line 79: The frozen PDF design remains the visual authority.
Line 80: This final line marks the end of the runtime fixture.
